

Using meth can leave you
with one scary smile

Repeated use of the drug methamphetamine may result in a condition known as “meth mouth”. Meth mouth symptoms include dry mouth, gum disease, tooth decay, and cracked teeth. In many cases the dental damage may be so severe that the only solution is complete removal of the teeth. Aren't you a little young to be wearing dentures?

Other ugly side effects of meth usage include:

- Extreme weight loss
- Skin eruptions and infected sores
- Premature aging
- Foul odor
